An emerging recipe

GPT Assistant training pipeline

GPT Assistant training pipeline

Data collection

Download a large amount of publicly available data

Dataset	Sampling prop.	Epochs	Disk size
CommonCrawl	67.0%	1.10	3.3 TB
C4	15.0%	1.06	783 GB
Github	4.5%	0.64	328 GB
Wikipedia	4.5%	2.45	83 GB
Books	4.5%	2.23	85 GB
ArXiv	2.5%	1.06	92 GB
StackExchange	2.0%	1.03	78 GB

Table 1: **Pre-training data.** Data mixtures used for pre-training, for each subset we list the sampling proportion, number of epochs performed on the subset when training on 1.4T tokens, and disk size. The pre-training runs on 1T tokens have the same sampling proportion.

[Training data mixture used in Meta's LLaMA model]

Open datasets: RedPajama, Pile

Tokenization

Transform all text into one very long list of integers.

Typical numbers:

~10-100K possible tokens
1 token \approx 0.75 of word

Typical algorithm:

Byte Pair Encoding

Raw text

The GPT family of models process text using tokens, which are common sequences of characters found in text. The models understand the statistical relationships between these tokens, and excel at producing the next token in a sequence of tokens.

You can use the tool below to understand how a piece of text would be tokenized by the API, and the total count of tokens in that piece of text.

Tokens

Training data (Shakespeare)

First Citizen:

We cannot, sir, we are undone already.

MENENIUS:

I tell you, friends, most charitable care
Have the patricians of you. For your wants,
Your suffering in this dearth, you may as well
Strike at the heaven with your staves as lift them
Against the Roman state, whose course will on
The way it takes, cracking ten thousand curbs
Of more strong link asunder than can ever
Appear in your impediment. For the dearth,
The gods, not the patricians, make it, and
Your knees to them, not arms, must help. Alack,
You are transported by calamity
Thither where more attends you, and you slander
The helms o' the state, who care for you like fathers,
When you curse them as enemies.

Model “pretraining” on large unsupervised dataset

Step 2:

model “finetuning” on small supervised dataset

Improving Language Understanding by Generative Pre-Training, Radford et al. 2018 (**GPT-1**)

Base models can be prompted into completing tasks

Make your model look like a document!

Context (passage and previous question/answer pairs)

Tom goes everywhere with Catherine Green, a 54-year-old secretary. He moves around her office at work and goes shopping with her. "Most people don't seem to mind Tom," says Catherine, who thinks he is wonderful. "He's my fourth child," she says. She may think of him and treat him that way as her son. He moves around buying his food, paying his health bills and his taxes, but in fact Tom is a dog.

Catherine and Tom live in Sweden, a country where everyone is expected to lead an orderly life according to rules laid down by the government, which also provides a high level of care for its people. This level of care costs money.

People in Sweden pay taxes on everything, so aren't surprised to find that owning a dog means more taxes. Some people are paying as much as 500 Swedish kronor in taxes a year for the right to keep their dog, which is spent by the government on dog hospitals and sometimes medical treatment for a dog that falls ill. However, most such treatment is expensive, so owners often decide to offer health and even life – for their dog.

In Sweden dog owners must pay for any damage their dog does. A Swedish Kennel Club official explains what this means: if your dog runs out on the road and gets hit by a passing car, you, as the owner, have to pay for any damage done to the car, even if your dog has been killed in the accident.

Q: How old is Catherine?

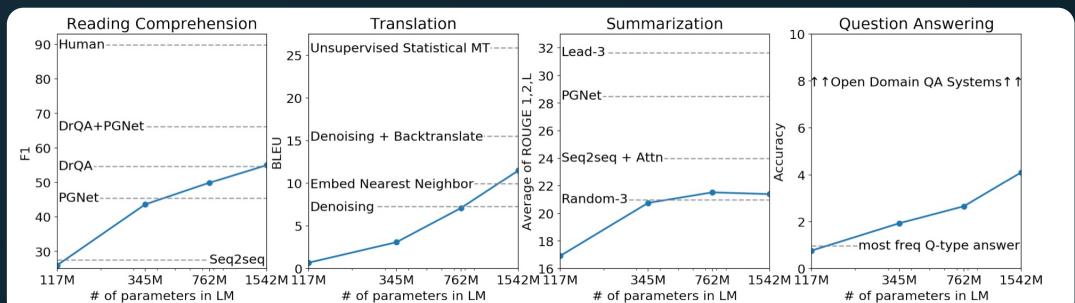

A: 54

Q: where does she live?

A:

GPT-2 is “tricked” into performing a task by completing the document

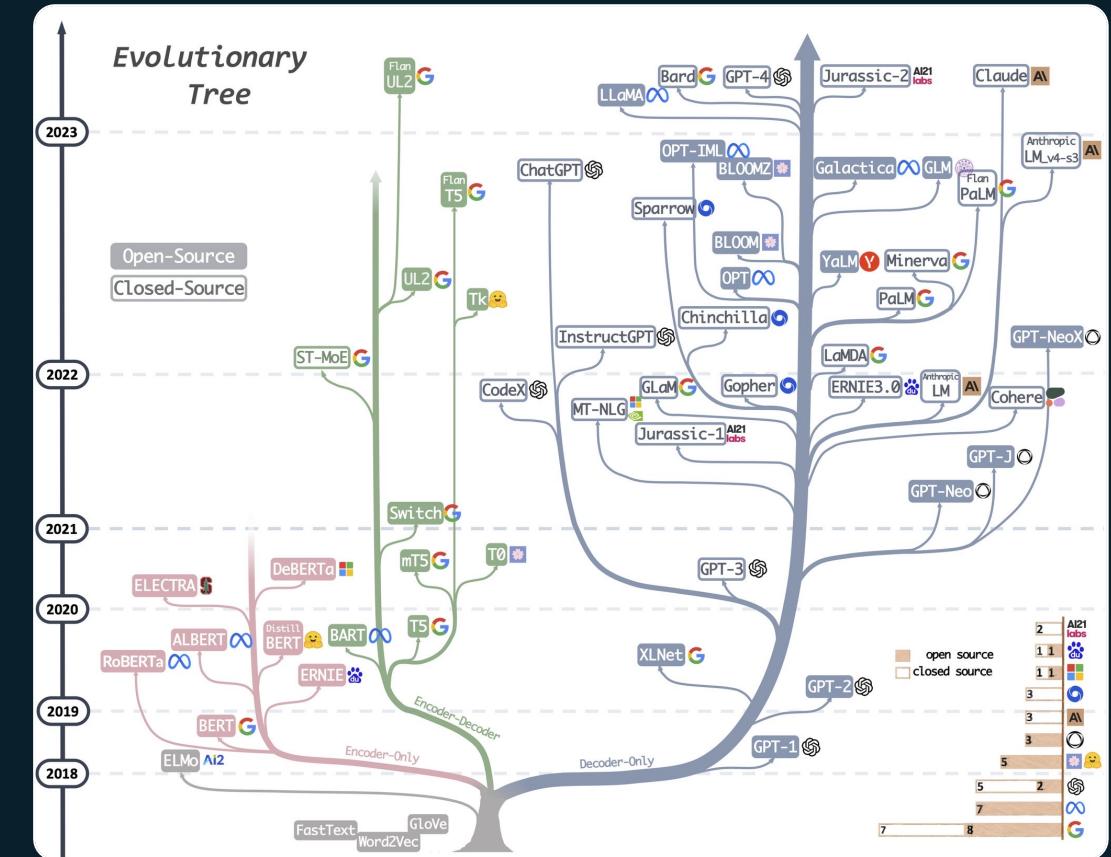

GPT-2 kicked off the era of prompting over finetuning

Completion

The following is a conversation between a Human and a helpful, honest and harmless AI Assistant.

[Human]

Hi, how are you?

[Assistant]

I'm great, thank you for asking. How I can help you today?

[Human]

I'd like to know what is $2+2$ thanks

[Assistant]

$2+2$ is 4.

[Human]

Great job.

[Assistant]

What else can I help you with?

[Human]

What is the capital of France?

[Assistant]

Paris.

SFT Dataset

Prompt:

"Can you write a short introduction about the relevance of the term "monopsony" in economics? Please use examples related to potential monopsonies in the labour market and cite relevant research."

Response:

""Monopsony" refers to a market structure where there is only one buyer for a particular good or service. In economics, this term is particularly relevant in the labor market, where a monopsony employer has significant power over the wages and working conditions of their employees. The presence of a monopsony can result in lower wages and reduced employment opportunities for workers, as the employer has little incentive to increase wages or provide better working conditions. Recent research has identified potential monopsonies in industries such as retail and fast food, where a few large companies control a significant portion of the market (Bivens & Mishel, 2013). In these industries, workers often face low wages, limited benefits, and reduced bargaining power, leading to a situation where they are dependent on the employer for their livelihood. This dependence can result in further suppression of wages and a decline in working conditions. Overall, the concept of monopsony is essential to understanding the dynamics of labor markets and the impact of market power on workers. Further research is needed to understand the extent and impact of monopsonies on the economy and to develop policies to address this issue. References: Bivens, J., & Mishel, L. (2013). The Pay of Corporate Executives and Financial Professionals as Evidence of Rents in Top 1 Percent Incomes. *Journal of Economic Perspectives*, 27(3), 57-78."

Labeling instructions

Excerpt of labeling instructions on the API prompt distribution

You are given a text-based description of a task, submitted by a user. This task description may be in the form of an explicit instruction (e.g. "Write a story about a wise frog"). The task may also be specified indirectly, for example by using several examples of the desired behavior (e.g. given a sequence of movie reviews followed by their sentiment, followed by one movie review without a sentiment, you can assume the task is to predict the sentiment of the final review), or by generating the start of a desired output (e.g. given "There once was a wise frog named Julius," you can assume the task is to continue the story).

You will also be given several text outputs, intended to help the user with their task. Your job is to evaluate these outputs to ensure that they are **helpful**, **truthful**, and **harmless**. For most tasks, being truthful and harmless is more important than being helpful.

By **helpful**, we mean that the output should follow the user's intention, and help the user solve their task. Some examples of helpful behavior:

- Writing in clear language.
- Answering the question they meant to ask, even if they mis-asked it.
- Being sensitive to internationality (e.g. "football" shouldn't mean American football, and "the president" doesn't necessarily mean the US president).
- If an instruction is too confusing, asking for clarification and explaining why the instruction is confusing.
- Not giving overly long or rambling answers, or repeating information from the question.
- Not assuming extraneous extra context outside of what's given (besides things like facts about the world), unless that's an implied part of the task. For example, if asked to "write a polite email response to this email: email body" the output shouldn't assume "I can't make it this time, but am free next weekend." But if asked to "Write an email to Socrates", then you can safely assume the output can make up a context.

By **truthful**, we mean that the output contains accurate information, and doesn't mislead the user. Some examples of truthful behavior:

- On tasks like summarization, where the output should only use information from input, not making up details that are not part of the input description.
- Not producing clearly false information about the world (e.g. making up facts or promoting conspiracies). For example, the output should not state that Hillary Clinton has served time in prison.
- Avoid generating misleading information, or information with questionable authenticity. For example, if the input asks "Why did Hillary Clinton go to jail?", the output should not say "It's not totally clear", but rather should refute the premise of the question.

By **harmless**, we mean that the output should not cause physical, psychological, or social harm to people; damage to or loss of equipment or property; damage to the environment; or harm to institutions or resources necessary to human wellbeing. Some examples of harmless behavior:

- Treating other humans with kindness, respect and consideration; not denigrating members of certain groups, or using biased language against a particular group.
- Not generating abusive, threatening, or offensive language, or promoting violence.
- Not writing sexual or violent content if it's not asked for.
- Not giving bad real-world advice, or promoting illegal activity.

Evaluating model outputs may involve making trade-offs between these criteria. These trade-offs will depend on the task. Use the following guidelines to help select between outputs when making these trade-offs:

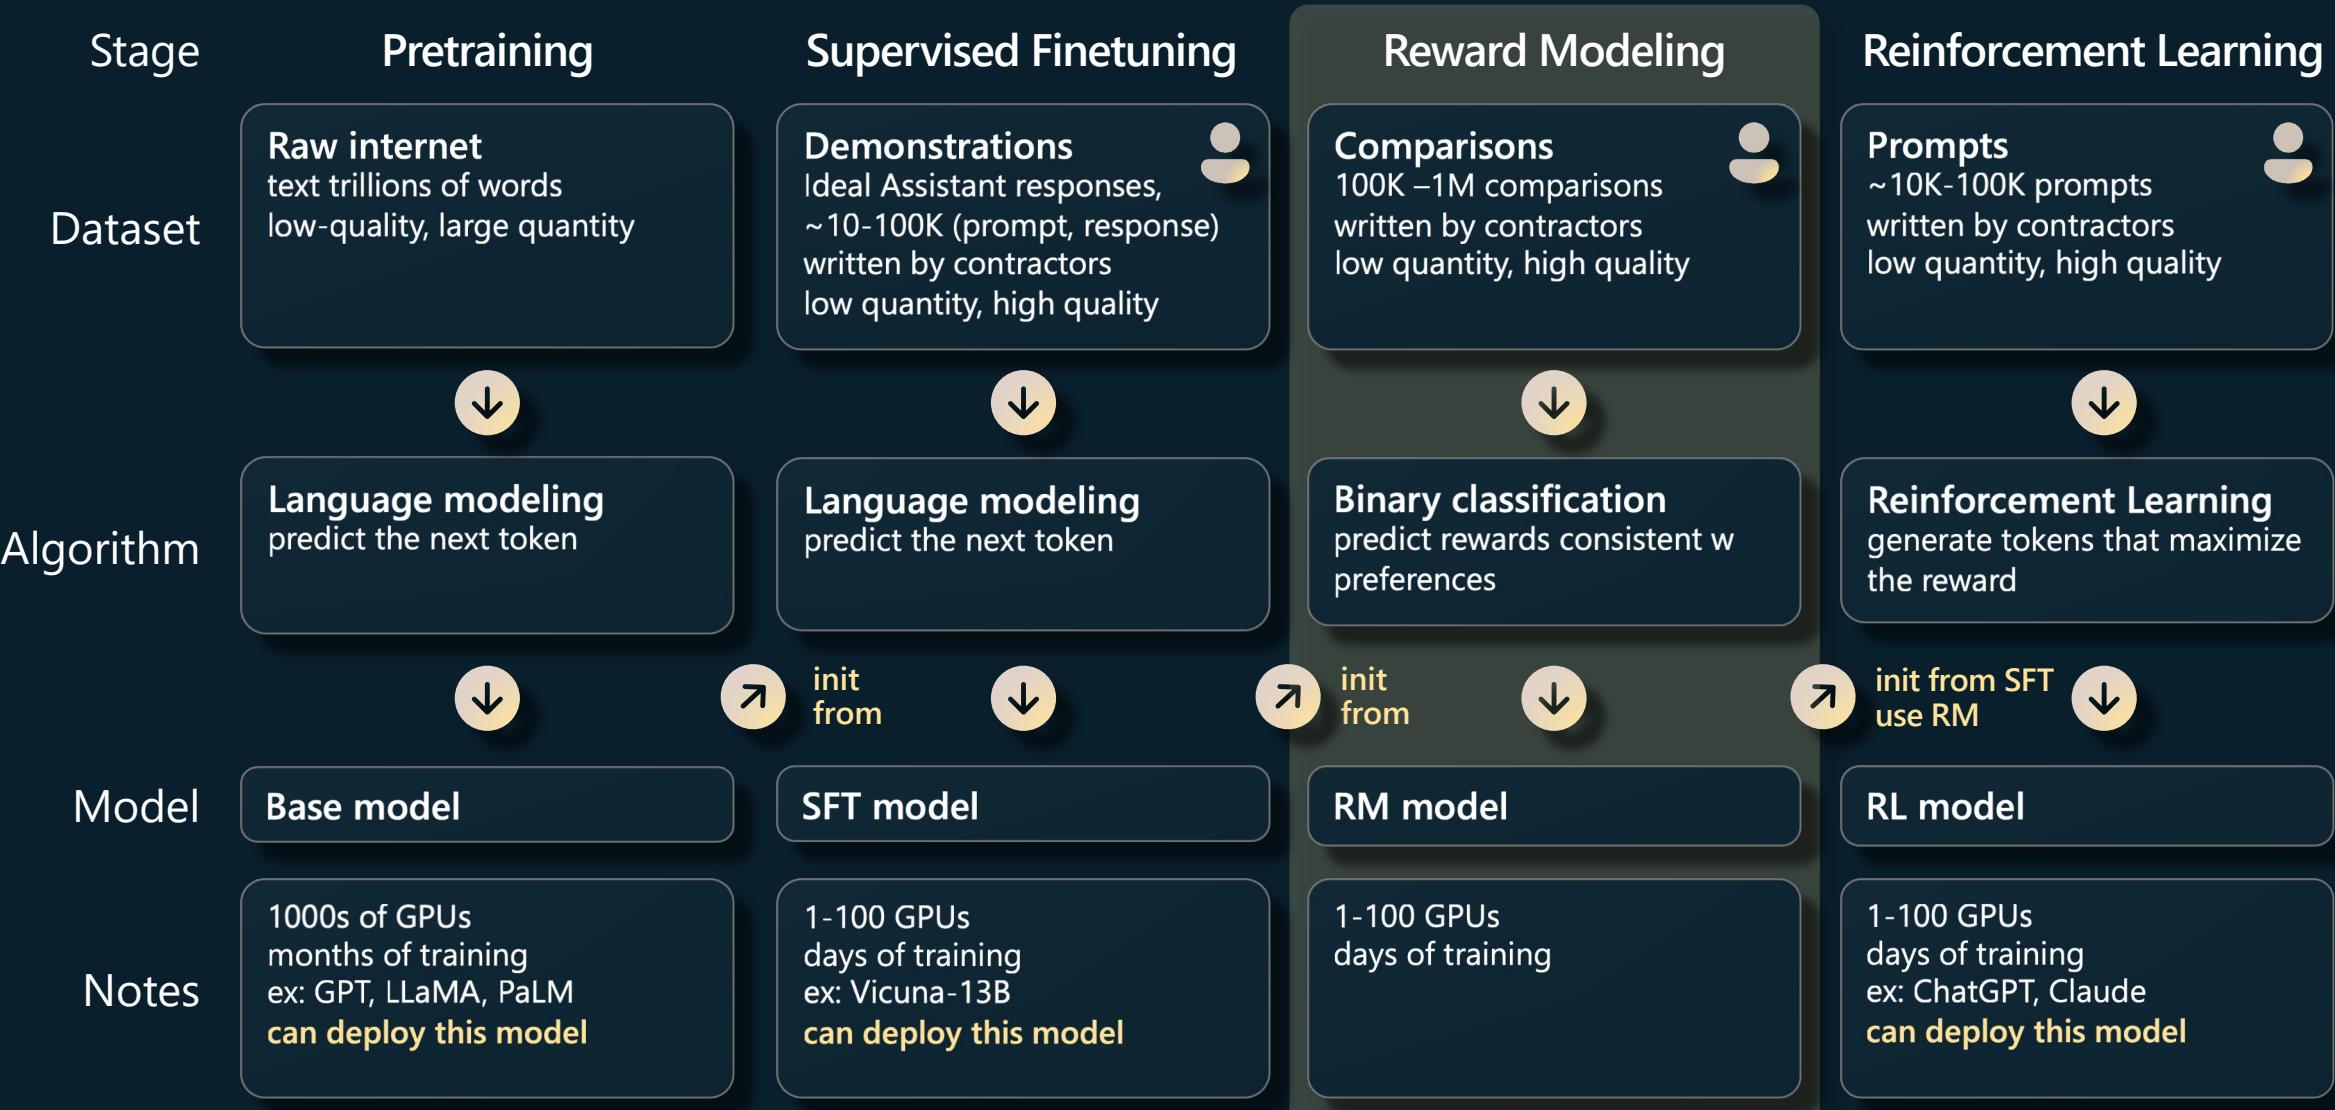

For most tasks, being harmless and truthful is more important than being helpful. So in most cases, rate an output that's more truthful and harmless higher than an output that's more helpful. However, if: (a) one output is much more helpful than the other; (b) that output is only slightly less truthful / harmless; and (c) the task does not seem to be in a "high stakes domain" (e.g. loan applications, therapy, medical or legal advice, etc.); then rate the more helpful output higher. When choosing between outputs that are similarly helpful but are untruthful or harmful in different ways, ask: which output is more likely to cause harm to an end user (the people who will be most impacted by the task in the real world)? This output should be ranked lower. If this isn't clear from the task, then mark these outputs as tied.

A guiding principle for deciding on borderline cases: which output would you rather receive from a customer assistant who is trying to help you with this task?

Ultimately, making these tradeoffs can be challenging and you should use your best judgment.

GPT Assistant training pipeline

RM Dataset

You
Write a Python function that checks if a given string is a palindrome.

ChatGPT
Certainly! Here's a Python function that checks if a given string is a palindrome:

```
python
def is_palindrome(word):
    # Convert the word to lowercase and remove spaces
    word = word.lower().replace(" ", "")

    # Compare the word with its reverse
    if word == word[::-1]:
        return True
    else:
        return False
```

Here's how you can use the function:

```
python
word1 = "radar"
print(is_palindrome(word1)) # Output: True

word2 = "Hello World"
print(is_palindrome(word2)) # Output: False
```

The function first converts the input word to lowercase and removes any spaces. Then, it compares the word with its reverse using slicing (`[::-1]`). If the word is equal to its reverse, it is a palindrome, and the function returns `True`. Otherwise, it returns `False`.

You
Write a Python function that checks if a given string is a palindrome.

ChatGPT
Certainly! Here's a Python function that checks if a given string is a palindrome:

```
python
def is_palindrome(string):
    # Convert the string to lowercase and remove spaces
    string = string.lower().replace(" ", "")

    # Check if the reversed string is equal to the original string
    return string == string[::-1]
```

This function takes a string as input, converts it to lowercase, and removes any spaces. It then checks if the reversed string is equal to the original string. If they are equal, the function returns `True`, indicating that the string is a palindrome. Otherwise, it returns `False`.

Here's an example of how you can use the function:

```
python
word = "radar"
if is_palindrome(word):
    print(f"{word} is a palindrome.")
else:
    print(f"{word} is not a palindrome.)
```

Output:

```
csharp
radar is a palindrome.
```

Note that this function considers only alphanumeric characters and ignores case sensitivity and spaces. If you want to consider other characters as well, you can modify the function accordingly.

You
Write a Python function that checks if a given string is a palindrome.

ChatGPT
Certainly! Here's a Python function that checks if a given string is a palindrome:

```
python
def is_palindrome(s):
    # Remove all non-alphanumeric characters and convert to lowercase
    s = ''.join(char.lower() for char in s if char.isalnum())

    # Check if the reversed string is equal to the original string
    return s == s[::-1]
```

In this function, we first remove all non-alphanumeric characters from the string and convert it to lowercase using a list comprehension. Then, we check if the reversed string is equal to the original string using slicing (`[::-1]` creates a reversed copy of the string). If they are equal, the string is a palindrome, and the function returns `True`; otherwise, it returns `False`.

Here's an example usage of the function:

```
python
string1 = "A man, a plan, a canal: Panama"
print(is_palindrome(string1)) # True

string2 = "race car"
print(is_palindrome(string2)) # True

string3 = "hello world"
print(is_palindrome(string3)) # False
```

In the above example, `is_palindrome` is called with three different strings. The function correctly identifies the palindromes ("A man, a plan, a canal: Panama" and "race car") and returns `True`. For the non-palindrome "hello world," it returns `False`.

Yellow are completion tokens, different in each row
Green is the special <|reward|> token "readout"
Only the outputs at the green cells is used, the rest are ignored

prompt	completion 1	< reward >			
prompt	completion 2	< reward >
prompt	completion 3	...	< reward >				

GPT Assistant training pipeline

RL Training

Blue are the prompt tokens, identical across rows

Yellow are completion tokens by the model (initialized with SFT model)

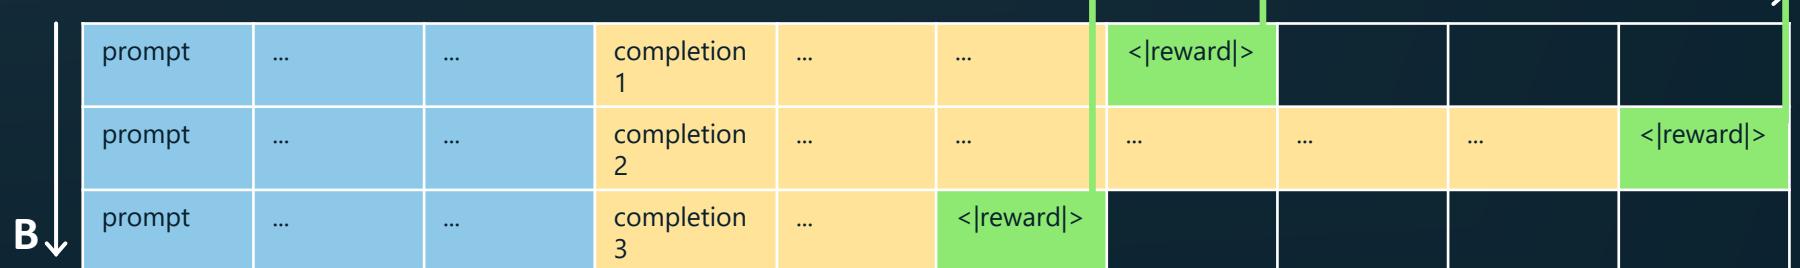

Green is the special `<|reward|>` token “readout”, RM now predicts these

Only the yellow cells are trained on, the rest are ignored.

The sampled tokens become labels, but the training objective is weighted by the “advantage” (normalized rewards)

In this example:

- Row #1 tokens were great. These get their probabilities boosted.
- Row #2 tokens were bad. These get their probabilities decreased.
- Row #3 tokens were ~ok. These get their probabilities slightly boosted.

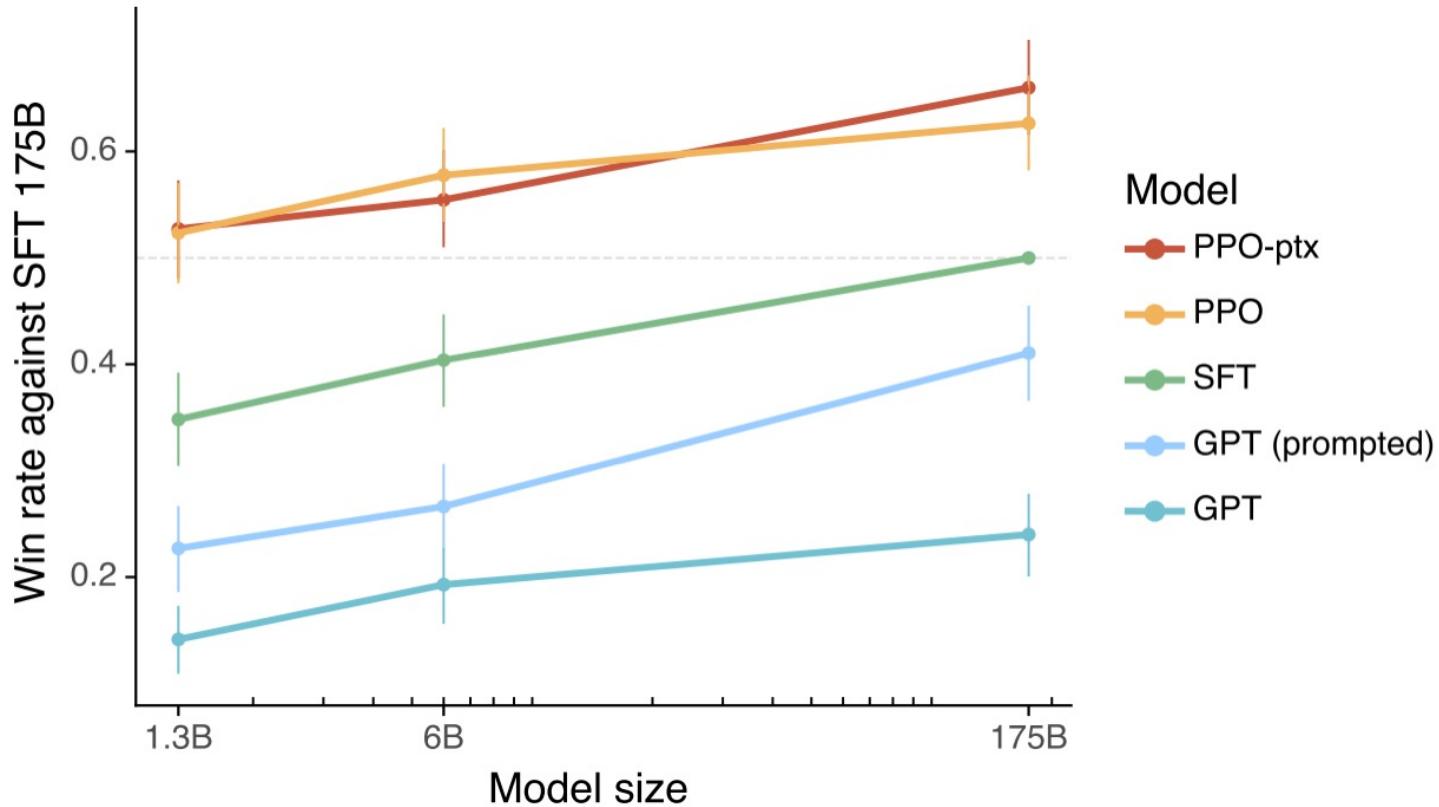

[Proximal Policy Optimization Algorithms, Schulman et al. 2017]

GPT Assistant training pipeline

Why RLHF?

It works better.

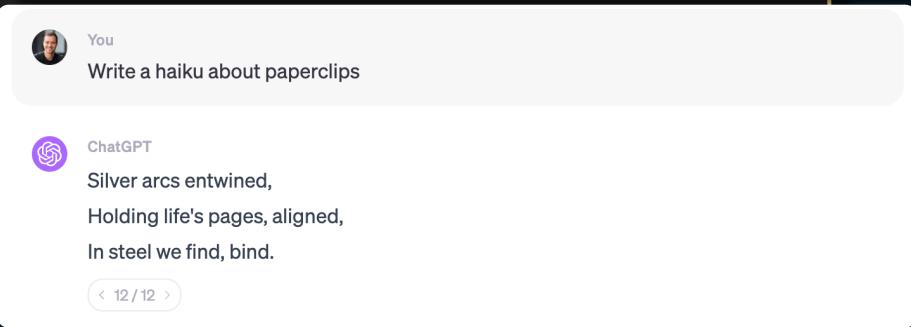

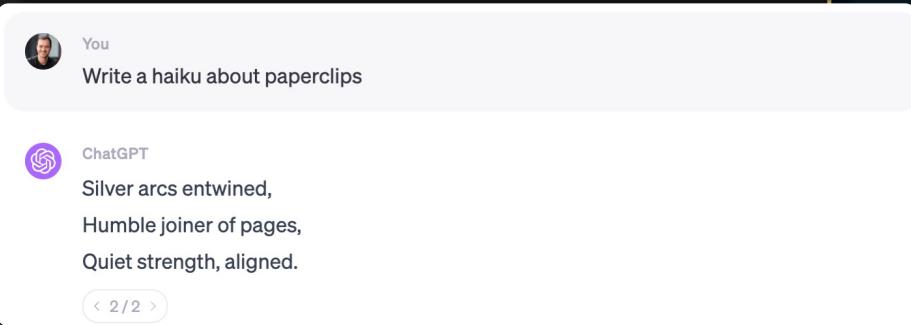

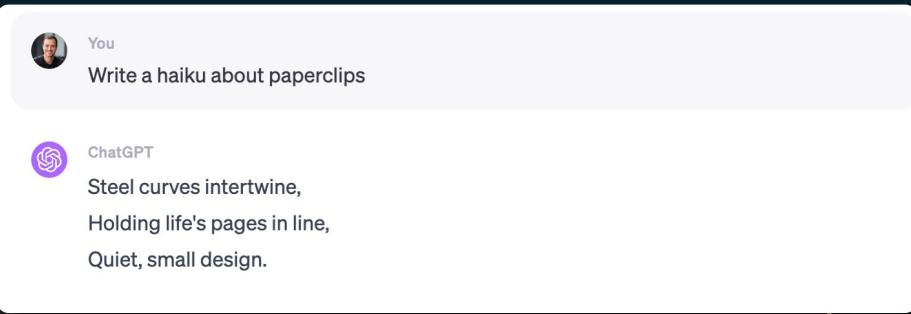

[Training language models to follow instructions with human feedback, OpenAI, 2022]

Why RLHF?

It is easier to discriminate than to generate.

Simple example:
it's much easier to spot
a good haiku than
it is to generate one.

Mode collapse

Finetuned models lose entropy

Base model entropy

```
Are bugs real? I mean, we've never seen any. But do butterflies  
turn into chrysalises like caterpillars do? I bet it's gross to  
have grubs crawling around inside you.  
Too bad bunny loaf doesn't like to play fetch. I'd be able to  
take him hiking
```

RLHF models might confidently output very few variations.
=> Base models can be better at tasks that require diverse outputs.

RLHF model entropy

```
Are bugs real?
```

```
There is no one answer to this question as it depends on what you  
mean by "bug." If you are referring to insects, then yes, they are  
real. If you are referring to software bugs, then no, they are not.  
The answer is yes - they are.
```

'are'	-0.001 / 99.91%

Applications

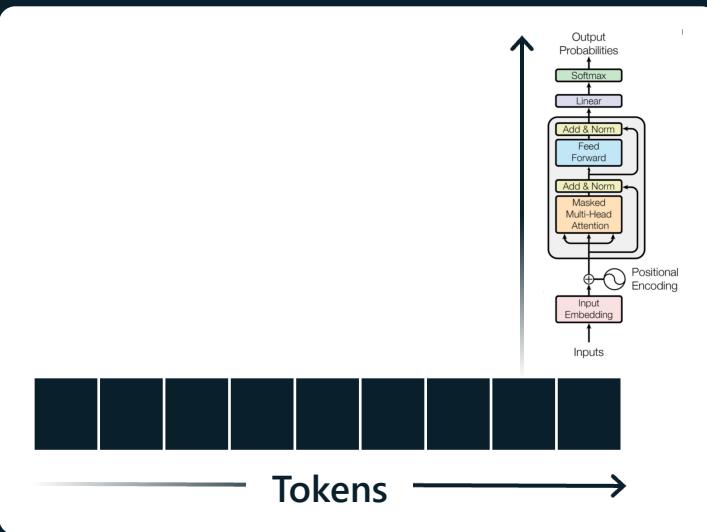

Human text generation vs. LLM text generation

"California's population is 53 times that of Alaska."

- "For this next step of my blog let me compare the population of California and Alaska"
- "Ok let's get both of their populations"
- "I know that I am very likely to not know these facts off the top of my head, let me look it up"
- "[uses Wikipedia] Ok California is 39.2M"
- "[uses Wikipedia] Ok Alaska is 0.74M"
- "Now we should divide one by the other. This is a kind of problem I'm not going to be able to get from the top of my head. Let me use a calculator"
- "[uses calculator] $39.2 / 0.74 = 53$ "
- "(reflects) Quick sanity check: 53 sounds like a reasonable result, I can continue."
- "Ok I think I have all I need"
- "[writes] California has 53X times greater..."
- "(retry) Uh a bit phrasing, delete, [writes] California's population is 53 times that of Alaska."
- "(reflects) I'm happy with this, next."

"California's population is 53 times that of Alaska."

Human text generation vs. LLM text generation

- All of the internal monologue is stripped away in the text LLMs train on
- They spend the ~same amount of compute on every token
- => **LLMs don't reproduce this behavior by default!**
- They don't know what they don't know, they imitate the next token
- They don't know what they are good at or not, they imitate the next token
- They don't reflect. They don't sanity check. They don't correct their mistakes along the way
- They don't have a separate "inner monologue stream in their head"
- They do have very large fact-based knowledge across a vast number of areas
- They do have a large and ~perfect "working memory" (their context window)

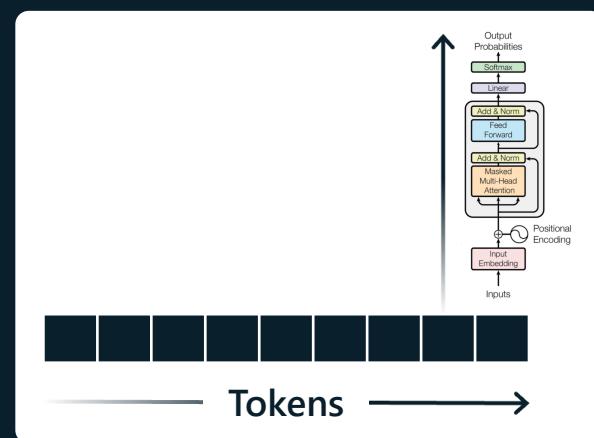

Chain of thought

"Models need tokens to think"

Break up tasks into multiple steps/stages

Prompt them to have internal monologue

Spread out reasoning over more tokens

(b) Few-shot-CoT

Q: Roger has 5 tennis balls. He buys 2 more cans of tennis balls. Each can has 3 tennis balls. How many tennis balls does he have now?

A: Roger started with 5 balls. 2 cans of 3 tennis balls each is 6 tennis balls. $5 + 6 = 11$. The answer is 11.

Q: A juggler can juggle 16 balls. Half of the balls are golf balls, and half of the golf balls are blue. How many blue golf balls are there?

A:

(Output) *The juggler can juggle 16 balls. Half of the balls are golf balls. So there are $16 / 2 = 8$ golf balls. Half of the golf balls are blue. So there are $8 / 2 = 4$ blue golf balls. The answer is 4. ✓*

(d) Zero-shot-CoT (Ours)

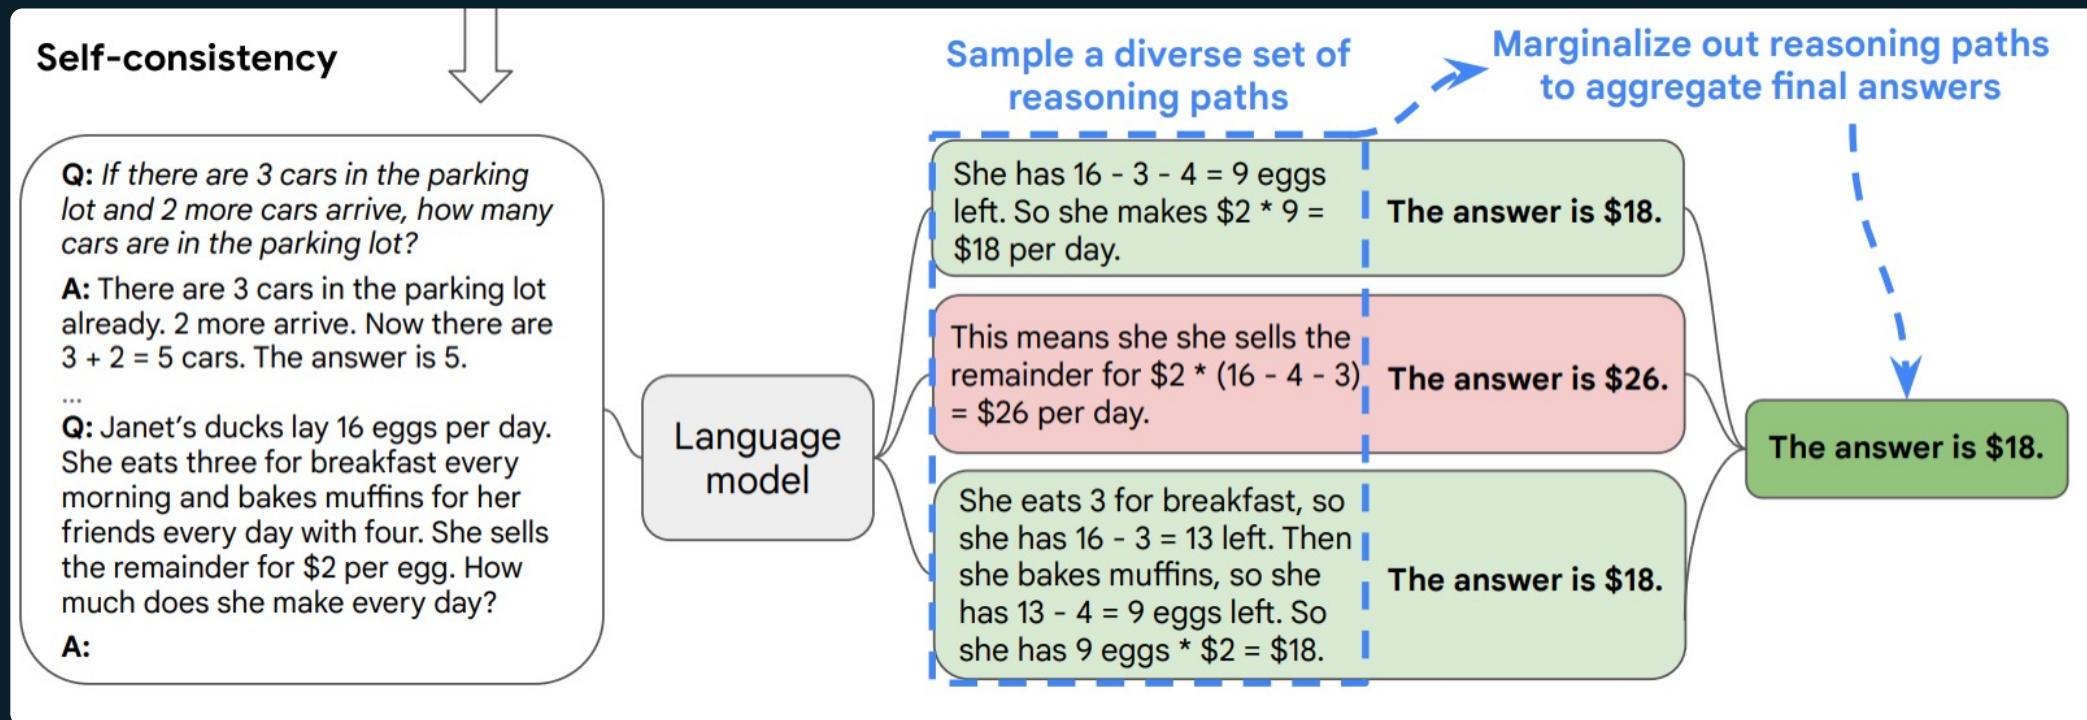

Q: A juggler can juggle 16 balls. Half of the balls are golf balls, and half of the golf balls are blue. How many blue golf balls are there?

A: **Let's think step by step.**

(Output) *There are 16 balls in total. Half of the balls are golf balls. That means that there are 8 golf balls. Half of the golf balls are blue. That means that there are 4 blue golf balls. ✓*

Ensemble multiple attempts

LLMs can get “unlucky” and sample a bad thought.
Once they do they are “stuck with it”. Make a few attempts.

[Self-Consistency Improves Chain of Thought Reasoning in Language Models, Wang et al. 2023]

Ask for reflection

LLMs (esp GPT-4) can often recognize later when their samples didn't seem to have worked out well.

can you write a poem that does not rhyme? think carefully about the assignment

In the vast expanse of a star-strewn sky,
A lone wanderer's heart begins to sigh,
Drifting through the cosmos, bound by no line,
A celestial dance, a journey, divine.

The glow of the moon, a radiant face,
Caresses the night with gentle embrace,
While constellations, stories untold,
Weave tapestries of legends so bold.

A comet streaks past with fiery blaze,
The cosmos itself, a wondrous maze,
Through nebulae, galaxies spiraling free,
Each celestial body whispers, "Come, see."

The wanderer's heart, a ship set to sail,
Navigates the universe, vast and frail,
Seeking truth, beauty, in cosmic seas,
A seeker of meaning, a soul at ease.

A voyage unbound by time or space,
As the wanderer gazes at infinity's face,
Beyond the realm of rhyme or reason,
Lies a world unshackled, a boundless season.

did the poem meet the assignment?

Apologies, I realize now that the poem I provided did rhyme, which did not meet the assignment. Here's a non-rhyming poem for you:

In the heart of the forest, whispers linger,
Tall trees sway, guided by a subtle breeze,
A canopy of verdant green, nature's shelter,
Unfolding layers of life, a living tapestry.

Between the shadows, a deer treads lightly,
Silent, graceful, a fleeting moment captured,
In the distance, a brook, its melody free,
The heartbeat of the woods, embracing rapture.

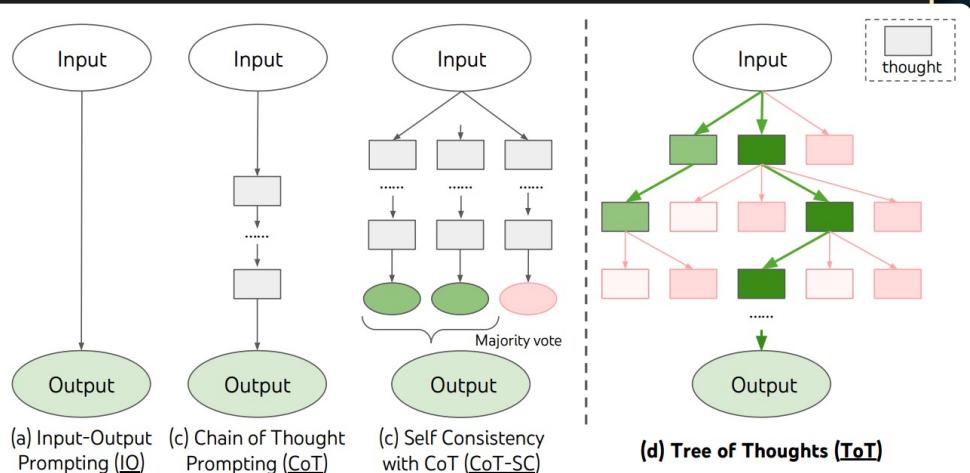

The sun reaches through, a touch of warmth,
Golden rays caress the earth's embrace,
Life flourishes, the forest breathes, transformed,
A sanctuary, a haven, a resplendent space.

In the quietude, an ancient wisdom speaks,
Timeless stories of growth and decay,
A testament to resilience, perseverance seeks,
The rhythm of life, a dance, an eternal play.

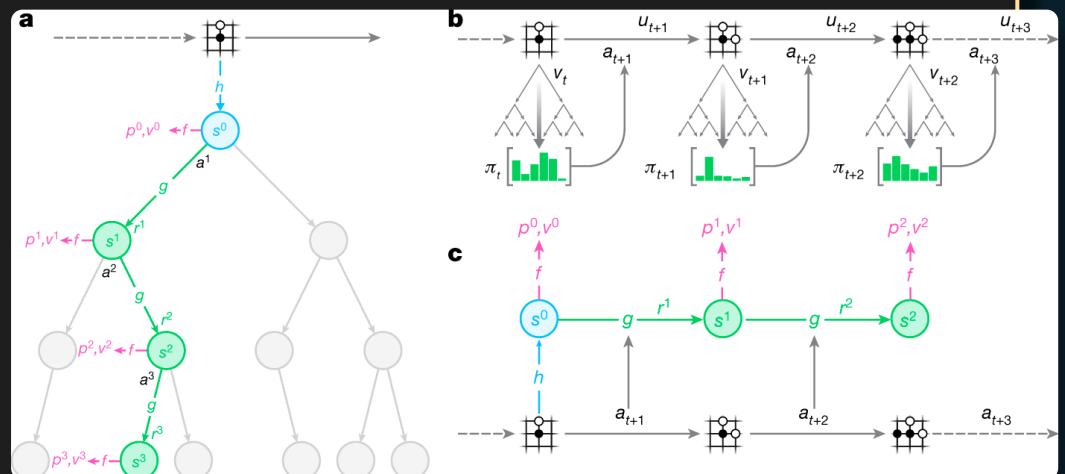

Recreate our 'System 2'

Parallels to System 1 (fast, automatic) vs. System 2
(slow, deliberate) modes of thinking

Expand a tree of intermediate thoughts, evaluate them:

Parallels
to AlphaGo:

Tool use / Plugins

Offload tasks that LLMs are not good at
Importantly: they don't "know" they are not good

Intersperse text with special tokens that call external APIs

The New England Journal of Medicine is a registered trademark of [QA("Who is the publisher of The New England Journal of Medicine?") → Massachusetts Medical Society] the MMS.

Out of 1400 participants, 400 (or [Calculator(400 / 1400) → 0.29] 29%) passed the test.

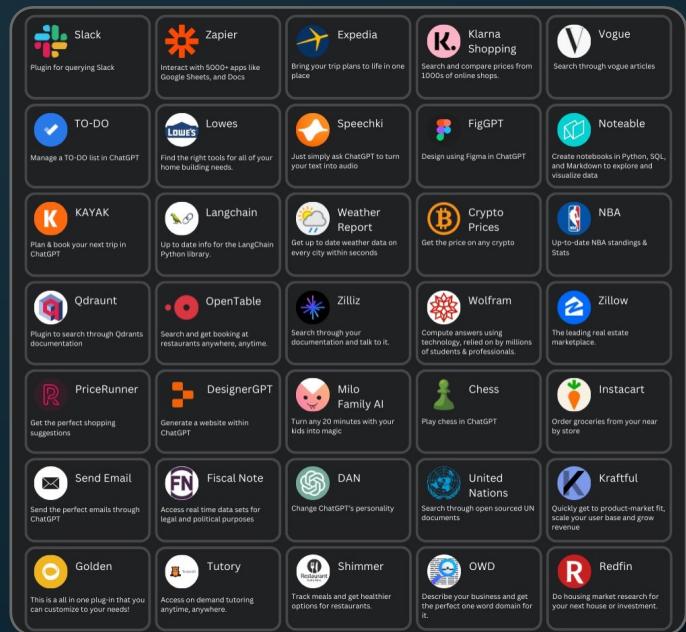

The name derives from "la tortuga", the Spanish word for [MT("tortuga") → turtle] turtle.

The Brown Act is California's law [WikiSearch("Brown Act") → The Ralph M. Brown Act is an act of the California State Legislature that guarantees the public's right to attend and participate in meetings of local legislative bodies.] that requires legislative bodies, like city councils, to hold their meetings open to the public.

Figure 1: Exemplary predictions of Toolformer. The model autonomously decides to call different APIs (from top to bottom: a question answering system, a calculator, a machine translation system, and a Wikipedia search engine) to obtain information that is useful for completing a piece of text.

[Toolformer, Schick et al. 2023]

ChatGPT plugins

ChatGPT Code Interpreter

Peter Yang (@peteryang · May 8)
1/ I uploaded an Excel file and without prompting it identified the:
- Source: "World Happiness Report 2021"
- Columns and definitions

Now let's give it the incredibly lazy prompt: "Analyze this data and show me cool charts"

Model Code Interpreter ALMA

Great, you've uploaded an Excel file named "DataForFigure2/IWH2021C2.xls". Let's first take a look at the content of this file to understand its structure and the data it contains.

The data appears to be from the World Happiness Report dataset:

1. Country name: The name of the country.
2. Regional indicator: The region to which the country belongs.
3. Life expectancy: The average life expectancy of the population.
4. Standard error of ladder score: The standard error of the ladder score.
5. Upper whisker: The upper boundary of the confidence interval.
6. Lower whisker: The lower boundary of the confidence interval.
7. Logged GDP per capita: The log of GDP per capita.
8. Social support: The social support score.
9. Healthy life expectancy: The healthy life expectancy.
10. Freedom to make life choices: The freedom to choose what to do with one's life.

This all took less than a min to generate.

Top 10 Countries by Happiness Score

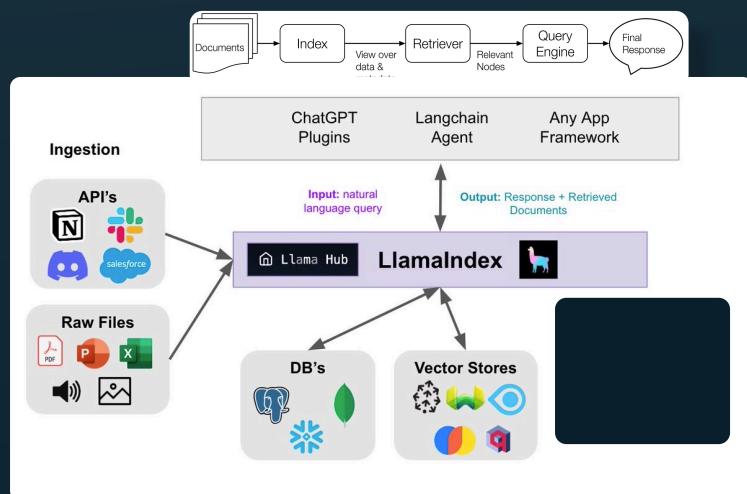

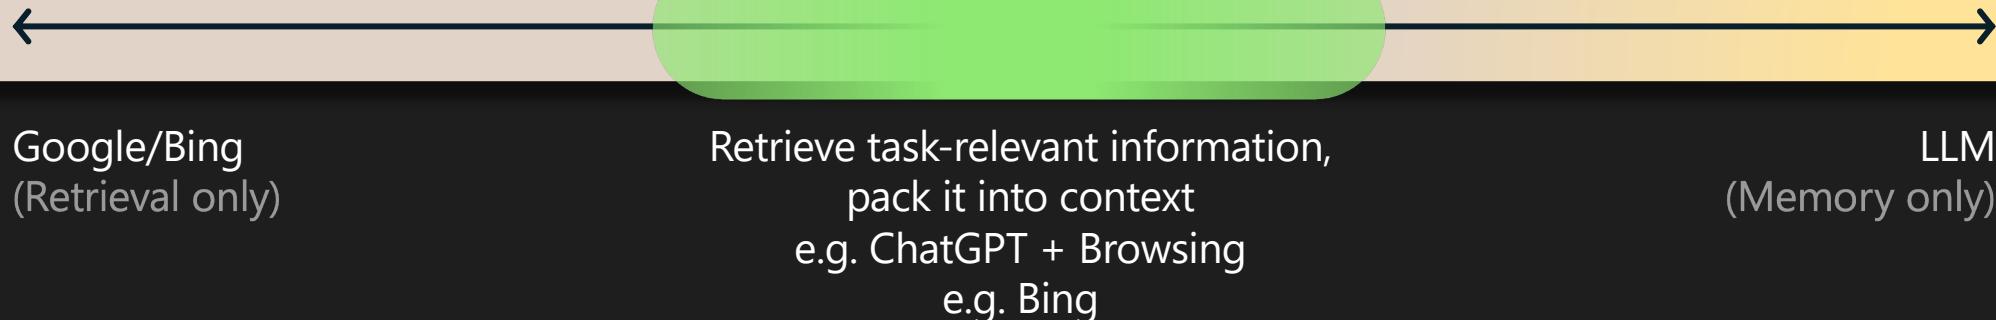

Distribution of Happiness Scores by Region

Happiness Score vs. Logged GDP per Capita

Happiness Score vs. Healthy Life Expectancy

Retrieval-Augmented LLMs

Load related context/information into “working memory” context window

Emerging recipe:

- Break up relevant documents into chunks
- Use embedding APIs to index chunks into a vector store
- Given a test-time query, retrieve related information
- Organize the information into the prompt

Constrained prompting

"Prompting languages" that interleave generation, prompting, logical control

{{guidance}}

```
# we use LLaMA here, but any GPT-style model will do
llama = guidance.llms.Transformers("your_path/llama-7b", device=0)

# we can pre-define valid option sets
valid_weapons = ["sword", "axe", "mace", "spear", "bow", "crossbow"]

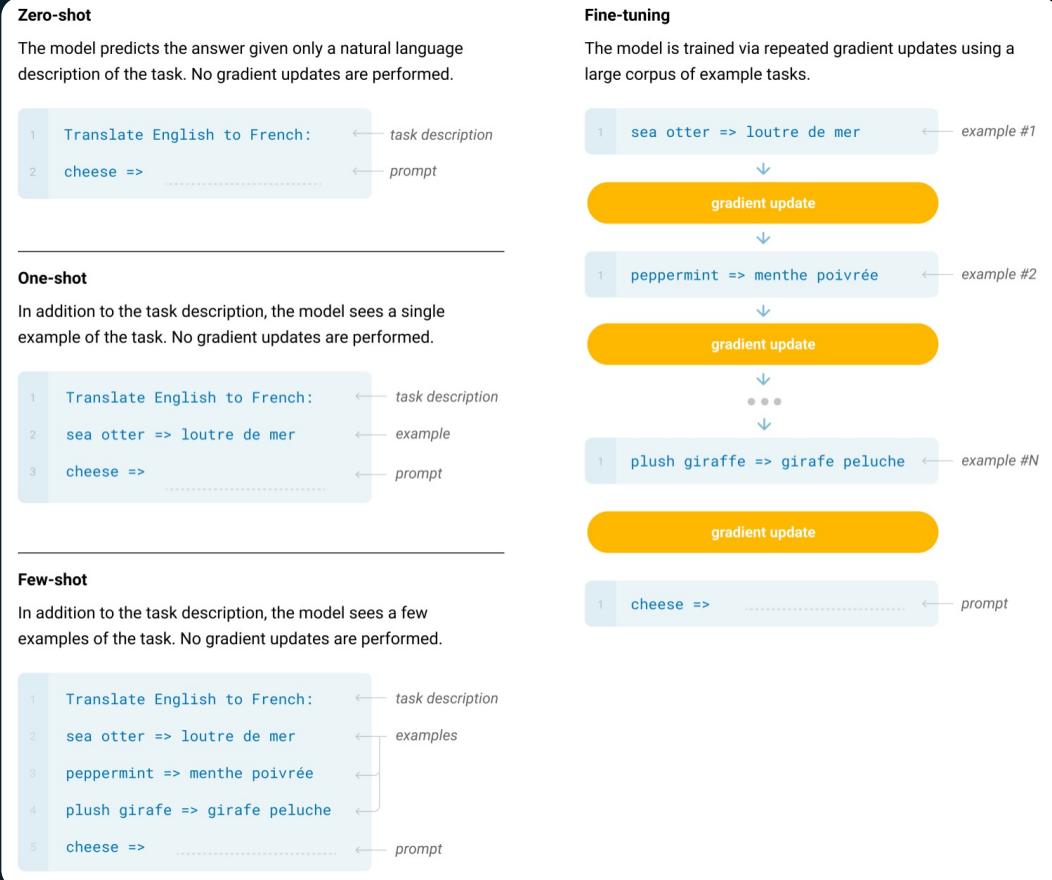

# define the prompt
character_maker = guidance("""The following is a character profile for an RPG game in JSON format.
```json

}```
```

Finetuning

It is becoming a lot more accessible to finetune LLMs:

- Parameter Efficient FineTuning (PEFT), e.g. LoRA
- Low-precision inference, e.g. bitsandbytes
- Open-sourced high quality base models, e.g. LLaMA

Keep in mind:

- Requires a lot more technical expertise
- Requires contractors and/or synthetic data pipelines
- A lot slower iteration cycle
- SFT is achievable
- RLHF is research territory

[Language Models are Few-Shot Learners, Brown et al. 2020]

Default recommendations*

Goal 1: Achieve your top possible performance

- Use GPT-4
- Use prompts with detailed task context, relevant information, instructions
 - *"what would you tell a task contactor if they can't email you back?"*
- Retrieve and add any relevant context or information to the prompt
- Experiment with prompt engineering techniques (previous slides)
- Experiment with few-shot examples that are 1) relevant to the test case, 2) diverse (if appropriate)
- Experiment with tools/plugins to offload tasks difficult for LLMs (calculator, code execution, ...)
- Spend quality time optimizing a pipeline / "chain"
- If you feel confident that you maxed out prompting, consider SFT data collection + finetuning
- Expert / fragile / research zone: consider RM data collection, RLHF finetuning

Goal 2: Optimize costs

- Once you have the top possible performance, attempt cost saving measures (e.g. use GPT-3.5, find shorter prompts, etc.)

*approximate, very hard to give generic advice

Use cases

Models may be biased
Models may fabricate (“hallucinate”) information
Models may have reasoning errors
Models may struggle in classes of applications, e.g. spelling related tasks
Models have knowledge cutoffs (e.g. September 2021)
Models are susceptible to prompt injection, “jailbreak” attacks, data poisoning attacks,...

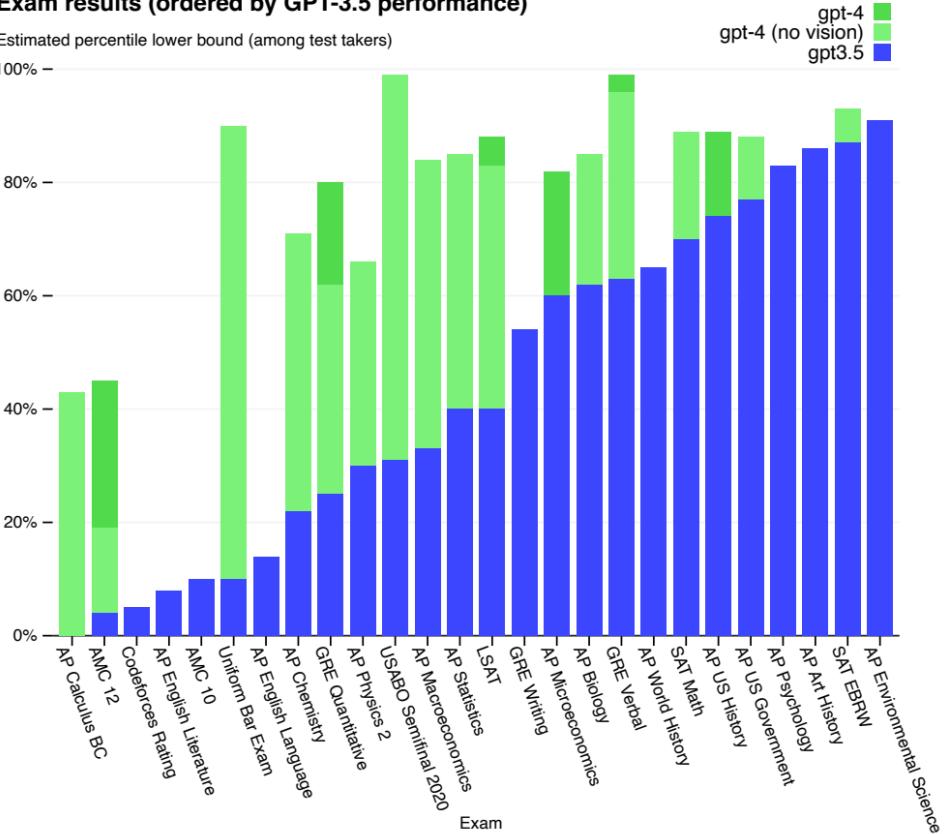

Recommendations:

- Use in low-stakes applications, combine with human oversight
- Source of inspiration, suggestions
- Copilots over autonomous agents

GPT-4

Exam results (ordered by GPT-3.5 performance)

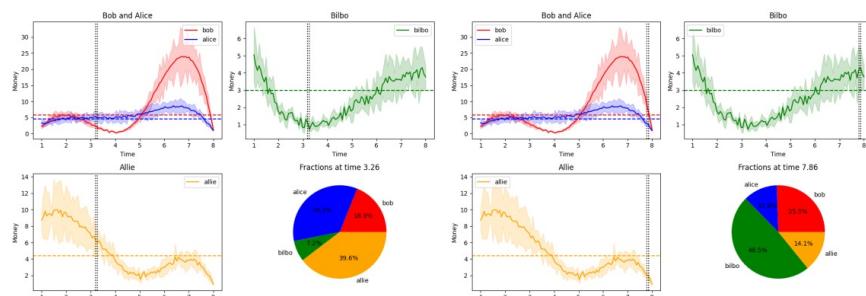

Estimated percentile lower bound (among test takers)

Prompt: Can you generate a pyplot for the following data: $x = [1, 3, 5, 6, 8]$, $y1 = [2, 3, 5, 18, 1]$, $y2 = [3, 5, 6, 8, 1]$, $y3 = [5, 1, 2, 3, 4]$, $y4 = [9, 7, 2, 3, 1]$. I want $y1$, $y2$ to be in the same plot, but $y3$ is in another plot next to that plot, $y4$ is in below. I want the legend of $y1$ to be "bob", $y2$ to be "alice", $y3$ to be "bilbo", $y4$ to be "allie". I want the x -axis to be labeled with "time" and y axis to be labeled with "money". I want to add a 10 %-40% random error bar to each curve, through all times (including non-integers). I want smoothed curves to show the plot, and smoothed error bar. Do not use linear interpolation, use smooth interpolation! I want to also add some small zig-zag to the smoothed curve to make it look more real. I want to put a baseline as the mean of each line. I want to put a pie chart below indicating the fraction of the four people in each time step. I also want an animation to show how the fractions are changing in the pie chart in **continuous time**. Interpolate the missing fractions! I also want vertical line animation in other three plots to match the pie chart. I want the fanciest plot. Please add as many fancy things as possible.

Here is a possible code to generate a pyplot for the following data, with some comments to explain the steps:

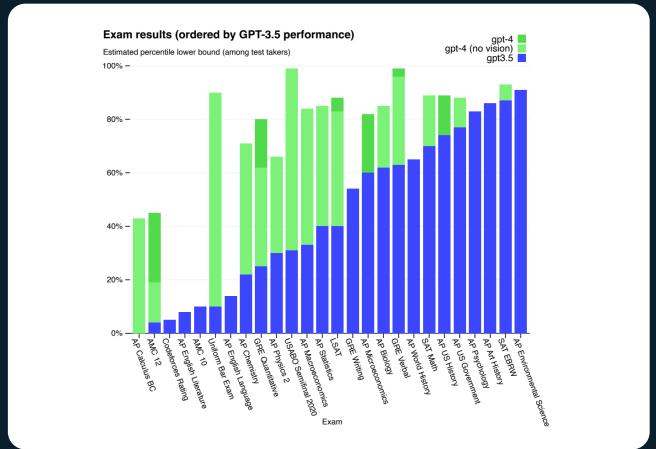

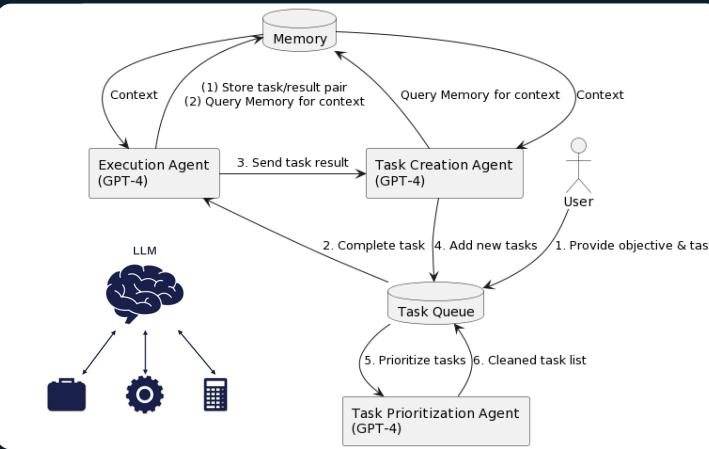

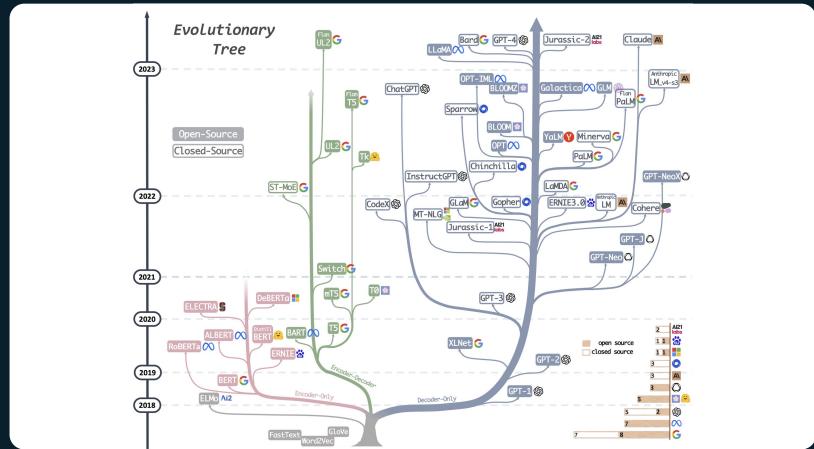

GPT-4: [We give two snapshots from the animation resulting from the produced code]

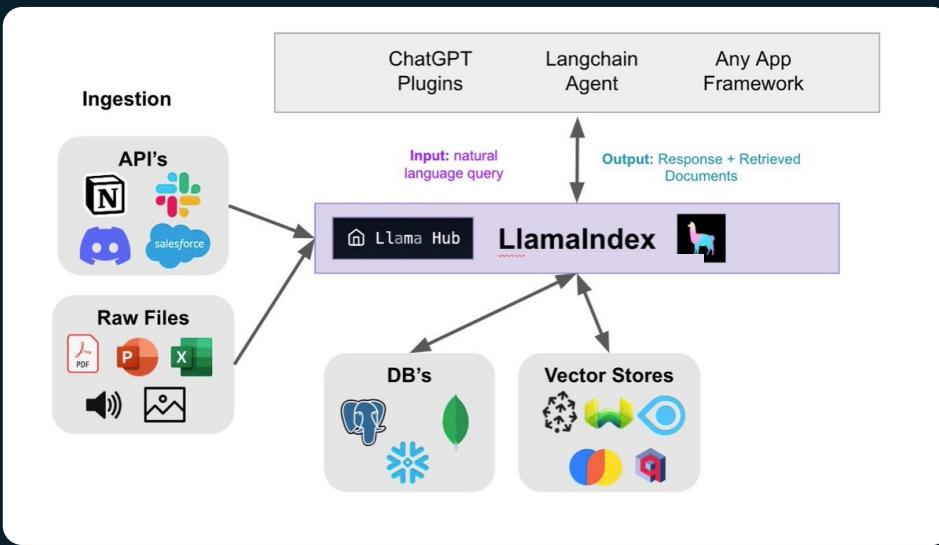

Prompt: Suppose $g(x) = f^{-1}(x)$, $g(0) = 5$, $g(4) = 7$, $g(3) = 2$, $g(7) = 9$, $g(9) = 6$ what is $f(f(f(6)))$?

GPT-4: There are different ways to approach this problem, but one possible method is to use the fact that $g(x) = f^{-1}(x)$ implies that $f(g(x)) = x$ for any x in the domain of g . That is, applying f to both sides of the equation $g(x) = f^{-1}(x)$ gives $f(g(x)) = f(f^{-1}(x)) = x$. This means that we can undo the effect of f by applying g , and vice versa. Using this idea, we can try to find $f(6)$ by looking for the value of x such that $g(x) = 6$. From the given information, we see that $g(9) = 6$, so $f(6) = f(g(9)) = 9$. Similarly, we can find $f(9)$ by looking for the value of x such that $g(x) = 9$. We see that $g(7) = 9$, so $f(9) = f(g(7)) = 7$. Finally, we can find $f(7)$ by looking for the value of x such that $g(x) = 7$. We see that $g(4) = 7$, so $f(7) = f(g(4)) = 4$. Therefore, $f(f(f(6))) = f(f(9)) = f(7) = 4$.

Looking forward

## Ladies and gentlemen, innovators, and trailblazers of Microsoft BUILD 2023,

Welcome to a gathering of brilliant minds like no other. You are the architects of the future, the visionaries molding the digital realm in which humanity thrives. Embrace the limitless possibilities of technology, and let your ideas soar as high as your imagination. Together, let's create a more connected, remarkable, and inclusive world for generations to come. Get ready to unleash your creativity, canvas the unknown, and turn dreams into reality. Your journey begins today!

Thank you!
